Answer Every Question: Review Record

Sep 30, 2026 · @Arnoldo Miranda

This record answers the findings about the paper made by the independent reviews of "Answer Every Question," Draft v6, through revision 68 (Parts 1 to 4) and by the reviews of revision 83 and later (Part 6). The reviews of this record itself, which also had the paper, led to corrections of this record made in place and to corrections of the paper (Parts 5 and 6). The paper is published under its own standard, so a finding about it is a question, and it is owed an answer (requirement 3). The record grows as new questions come in (requirement 4).

The reviews

Each review was asked for two things. Part A was false steps and contradictions only. Part B was everything else: gaps in the argument, claims larger than their evidence, Appendix A, and reader problems.

Label	Reviewer	Revision reviewed

Stopping rule. The paper is ready when a round finds no confirmed false steps and no contradictions, and every other finding is answered here. Revision 64 was taken to meet the first condition, since C4 and G3 put nothing in Part A. I then corrected in the text most of the findings this record had accepted (revision 65); each row says whether it was corrected. The reviews of revisions 65 to 67 found new Part A problems, most of them introduced by those corrections, and each was fixed (Part 1). Revision 68 was taken to meet the first condition, since C8 and G5 put nothing in Part A. Reviews of this record later showed that at least seven findings filed in Part B were false steps, by the paper's definition as record 5.3 reads it (Section 3, "False step"): revision 65 had corrected three,

revision 71 three more, and revision 77 the seventh (record 5.3). Revision 73 carried out in the paper most of the steps this record had accepted as missing from Appendix A, and corrected four places where the paper did not match its own definitions or labels (record 5.3). Revision 74 carried out the steps a review of revision 73 found still missing, and revision 75 corrected four more places that a review of revision 74 found, revision 76 four more that a review of revision 75 found, revision 77 the seventh false step and one citation that a review of revision 76 found, and revision 78 the count in Appendix C.3 and the case D = T in L6, step 3, revision 79 the range of A.12, item 5, revision 80 a step in L2, step 1, revision 81 the citations of A1 in A.12, and revision 82 further citations in A.12 and two breaks in Section 5.3, row 1 (record 5.3). Revision 82 met the first condition in the round of C33 and G30. Revision 83 and later revisions were reviewed in rounds. Part 6 gives each finding about the paper from those rounds, who raised it, and its answer. Revision 94 met the first condition in the round of C54 and G37. A confirming review, G38, found, as G35 had, that Section 4.2 widened the Leiden Declaration's condition; revision 95 corrects it. Revision 95 met the first condition in the round of C55 and G39. This record is the second condition.

Parts 2 and 3 answer the reviews of revisions 61 to 64, and quote the paper as it stood in the revision reviewed. Most findings they mark Accepted were corrected in the text in revision 65, and those rows say so. **Part 4 answers the reviews of revisions 65 to 68**, as the findings stand on revision 68; one row also names C19, a later review that raised the same finding; a row marked "Fixed in revision N" describes that revision.

How to read the answers.

- **Accepted** means the finding was right when it was raised. Where the text was later corrected, the row says "Fixed in revision N." Otherwise the answer supplies what is missing, so the reader does not have to supply it.
- **Answered** means the finding does not hold, and the answer says why from the page or the sources.
- "Accepted in part," "Accepted as a reading" and "Accepted as wording" mean Accepted, with the limit stated. A row in Part 2 has no label because none of its findings shows a defect in the paper. A row in Parts 3.1, 3.2 or 3.5 with no label supplies what the reader needed; where it says "Fixed in revision N," it counts as Accepted.
- "Record 3.4" means Part 3.4 of this record, and "Section 3.4" means the paper's section. Where a row gives a bare number, the column says which: in Part 4.1, "Where answered" gives parts of this record. "Record A1" means a Part A finding in Part 1; "A1" alone means the paper's foundation item. "C.1" (with a period) is a section of Appendix C; "C1" is a reviewer. In Part 1's first column, A1 to A7 number the Part A findings; inside

the words of Part 1's finding A5, "A1 to A7" are the 07:48 reply's labels. In a Finding column, a bare number such as "5.6" is a section of the paper; "A.12" is a section of Appendix A, and "A12" a foundation item.

Part 1. Part A findings, and how each was resolved

#	Finding	Raised by	Resolution
A1	Section 7.1 said Section 9.1, item 5 adopts the Group's item 3 (model, prompts, chain of thought, time, cost). Item 5 did not include them.	C1	Fixed in revision 62. Item 5 now includes them.
A2	Section 1.1 quoted MIT Technology Review ("released just last week") but cited only Lee's posts.	C2 (Part B, confirmed as a false citation)	Fixed in revision 63. The row cites Ref. 8.
A3	Section 8.3 required "someone who can check the answers" to move a result from course 2.B to 2.A. Section 7.2 and the four requirements did not.	C2, C3	Fixed in revision 64. Understanding is now part of requirement 3: the presenter answers from their own understanding, and relaying an answer the presenter cannot check does not meet the duty. Section 3, the Abstract, and Sections 7.2, 9.1, 9.4 and 10 say the same.
A4	Section 3's new definition of "answered for" ("has answered, or is answering") did not match Section 6.1 and the Section 6 table ("has answered").	C5	Fixed in revision 66. All three now say "has answered, or is answering."

#	Finding	Raised by	Resolution
A5	The Appendix D introduction said the last reply's labels L1 to L6 differ from Appendix A's. They name the same lemmas; only A1 to A7 differ.	C6	Fixed in revision 67.
A6	Section 3 defines a question as a request for a reason, but Sections 5.3, 5.4 and the Abstract called question 2 "an order."	C6	Fixed in revision 67. Question 2 demanded the skipped steps, and the text now says so.
A7	Section 3 said its terms are used "in exactly these senses throughout," while Sections 4.3 and 5.6 use "reader" for people who fill in steps.	C7	Fixed in revision 68. Section 3 now says the defined senses apply wherever the paper states the standard or applies it to a proof or a presenter, and that the words keep their ordinary meanings where the paper describes other people's practice or the records in Appendices B and D.

Part 2. Findings that do not hold

Finding	Raised by	Answer
The 7,200 signatures in Section 1.1 have no source.	G1	Ref. 5 (Doğan): "By 16 September, the declaration's website listed more than 7,200 signatories."

Finding	Raised by	Answer
The withdrawn sentences in Appendix D are a false description of what the paper asserts.	G1	Appendix D is the exchange as recorded. Its introduction says notes added in revision are in square brackets, and each withdrawn sentence has a note in the same reply. The 07:48 note comes at the end of that reply and quotes the sentences it withdraws.
Figure 1 is missing.	C2, G1, C1	It is in the PDF. The markdown export carries only a placeholder.
The smaller circle is given but not used.	G1	Appendix A.2 says so: "The smaller circle is used only to fix B and C; no step of the proof uses it further." Section A.12 shows the whole configuration, smaller circle included, exists.
Section 6.5 says "Every question … is part of digesting it."	G1	That sentence is not in Draft v6. It was in Draft v5, and Draft v6 replaced it with a labeled reading.
The Section 1.1 table runs on after Section 1.2 begins; Section 1.2 ends mid-sentence.	G2, G3	In the PDF the table ends on page 3 and "1.2 Terms" follows it. A list that continues onto the next page is a page break, not a break in the text.
Question 5 is counted as exposing a defect although it was partly mistaken.	G3	Section 5.4 gives both: the theorem was named once, in the plan (the mistaken part), and it was not named where it was proved and used (the defect). Appendix D, 07:43, records Claude saying "the omission is mine."
Question 7 is quoted in a short form.	G3	The omitted words are marked "…", and Section 5.3 says so. Appendix D gives the message as typed, with strong language omitted and marked "…".

Part 3. Answers to Part B findings, by subject

3.1 My readings and proposals

Several findings say that a claim is my reading or proposal, not something derived from the sources. That is right, and it is deliberate. The paper's central positions are mine, and where they are argued the paper says so: Section 2.1 ("as I read them"), Section 4.3 ("I propose"), Section 6.5 ("this reading is mine"), Section 7.2 ("I propose a test"), Section 8.1 ("I read Nguyen's first point") and Section 8.3 ("I propose one use").

The reviewers list other places where the same positions appear without the label. Each is to be read with the label of the section where the position is argued, given in the third column:

Place	Position	Argued in	Raised by
2.1, second bullet ("Two describe a process cut short"; the paper now reads "Two, as I read them")	the grouping of the complaints	2.1	C3, G1, G2, G3
Abstract; 4.3 ("no such record to rest on," "the credit that a record of answering earns"); 10	latitude is earned by a record of answering	4.3	C3, C4, G1
Section 6 table, proxy row ("The work of digesting a result")	digesting includes questions and answers	6.5	C2, C4, G1, G3
6.1 ("someone who can give the reason for every step")	the part of understanding a bare statement lacks	2.1	C1, C2, C3, C4
6.2 ("each question is a small discussion")	the record extends discussion and write-up	6.2	C1, C2, C3, C4
6.3 ("part of understanding a result")	provenance is part of understanding	6.3	C1, C2, C3
6.5 ("does some of the thinking the solver would have done")	questioning recovers part of the solving	6.5	C2

Place	Position	Argued in	Raised by
7.2, item 1	answering as the test of "take full responsibility"	7.2	G1, G2
8.3 ("Deep involvement … check those answers rather than relay them")	the use of deep involvement	8.3, and now requirement 3	G2
10 ("can be checked, taught and built on when someone answers for it")	the conclusion of Sections 4 to 9	4 to 9	C1, C2, C3

Section 4.3, "the same rule." Several reviewers ask how a standard that gives no one latitude can weigh more on AI because AI lacks latitude (C2, C3, C4). The answer is that "the same rule" in Section 4.3 and in Section 10 means the field's convention, not the standard. Under the convention as I read it (Section 4.3), readers let a presenter with a record of answering skip steps. AI output has no such record, so under the convention it gets no latitude. Under the standard no one gets latitude. The standard therefore asks the same of everyone, but it changes practice most for AI output, because AI output is the case the convention cannot excuse. Fixed in revision 65: Section 4.3 now says "the same convention."

Section 4.3, "of this kind" and volume. The declaration dates the abilities at issue to "the last few months." "Of this kind" means proofs produced with those abilities; no presenter can have answered for them over years (C4, G1). "Output can arrive faster than readers can fill in skipped steps" claims a possibility, supported by ten results in one report. It does not claim a measured rate (C3, G1). That such output can outpace readers is my reading.

Section 7.2 and the Group's three clauses (G1). The Group's norm names understanding, verification and responsibility. My test addresses all three only if understanding is shown by answering. Since revision 64, requirement 3 makes that explicit: the presenter answers from their own understanding and can check each answer. In my reading, checking each answer is the verification the clause asks for. Whether the test places a result in the Group's course 2.A, rather than in a category the Group does not name, is for the Group to decide (Section 9.2 proposes it).

Section 7.5, answering is not directing (C1, C2, C3). The Group's concern is that labs not direct the community's work of understanding. A presenter who answers does not choose the questions; the community does. Section 7.5 adds that the community judges whether the answers hold. A presenter could still shape understanding through its answers; that the record (Section 9.1, item 4) lets others see and dispute them is my answer here, not in the paper.

Section 7.6, no access to the model (C1, C3). For questions about how a result was produced, the reader depends on the presenter's answer, which is Section 7.6's point; Section 9.1, item 5 asks for the disclosures that let others check it.

Section 6.1, volume (G1, G3). The standard sets no limit on the number of releases (Section 6.1). It bears on volume only through requirement 3: a presenter who releases more than they can answer for, from their own understanding, fails it. Section 6.1 calls this a requirement on presenters, not a limit that enforces itself.

3.2 The definitions and the duty

Consequence 1, "can be resolved by answering" (C1, C2, C4). Pointing to where a step is on the page supplies the step asked for. The consequence says disagreement "can be" resolved, not that it will be. Once the step is on the page, each reader can check it, and a reader who still disagrees has a new question to put.

"Answered for" and time to answer (C4). Accepted. Read literally, "has answered every question put so far" fails the moment a question is put. The intended reading: every question put has been answered or is being answered. What shows the condition is not met is a question left unanswered. Fixed in revision 65.

Who holds the duty in course 2.B (C2, C4). The lab that releases a course 2.B result is its presenter and holds the duty. Since revision 64, the duty is to answer from one's own understanding, which no one has yet for a course 2.B result ("not yet understood by anybody"). The result is therefore not answered for until someone who can meet the duty takes it on.

Section 7.3, "a person questions, the AI answers" (C4). Since revision 64 this needs a gloss. In Section 5 the AI drafted the answers. The method is that I, as presenter, accept an answer only once I can check it; Appendix C.4 says the rule was not always kept. I own every claim in the paper (Appendix C.1). The presenter's answer is the one the presenter accepts and can explain. Fixed in revision 65: Section 7.3 now says the AI drafts answers, and the person accepts an answer only when the person can check it.

Section 7.3, "nothing is accepted until the missing step is on the page," against Appendix C.4 (C4). Section 7.3 describes the method shown in Section 5. Appendix C.4 says the rule was not always kept across the whole collaboration, and C.3 lists where.

Section 8.3 cites Section 9.4 for "owns every answer" (C1, C2, C4). Since revision 64, Section 9.4 says the person "understands every answer given in their name." "Owns every answer" follows from requirement 3: the presenter answers, from their own understanding, whoever drafted the words. Fixed in revision 65: Section 8.3 now cites Section 4.1, requirement 3, and Section 9.4.

Question and tone as stipulations (G1). Accepted. They are stipulated. Section 3 defines question, Section 4.1 states the rule on tone, and Section 4.2 gives where the duty comes from; none argues that the definition or the rule is right. They are my position.

3.3 Claims larger than their evidence

Finding	Raised by	Answer
1.1: "OpenAI denies it" is broader than the denial reported in 6.3.	C2, C3, C1	Answered. Ref. 8: "OpenAI has denied the accusations." Section 6.3 reports the narrower exchange about transcripts.
5.6: "had to expand himself."	C3, C4	Accepted. Fixed in revision 65. Lee says "Some proofs are expanded with more details." "Had to" is my inference that the report left them unexpanded.
5.6: "the report's main theorem is that they agree."	C1, C4	Accepted. Ref. 6 describes its subject as "the exact asymptotic rate of the optimal Cohn-Elkies linear program and the sign-uncertainty constant": two results, of which the first is the one whose upper and lower bounds agree. Fixed in revision 71: Section 5.6 now says "one of the report's two main results."
5.6: Lee's work shows what the standard asks of a presenter.	C3, G3	Accepted as a reading. Fixed in revision 65. His posts record work a reader did; they do not record OpenAI being asked.

Finding	Raised by	Answer
5.3, question 1: "nothing said why AB pairs with AT."	C1, C2, C3, C4	Accepted in part. Fixed in revision 65. The table in Appendix B writes "△ABT ~ △ATC" in matched order and pairs the angles at A and the right angles. What it never gave was the reason the sides pair: the third angle and the step from matched angles to matched sides. "Gave no correspondence of vertices" is true of the quoted caption.
5.3, question 7: "every other step proved," but the 07:48 reply listed what it still did not do.	C3	Answered. The row's last column says "the proof that became Appendix A." The 07:48 page was completed later.
Abstract: "an answer" when the defects were in three successive answers.	C3	Accepted. Fixed in revision 65. The defects were in the answers at 07:17, 07:25 and 07:31 (Section 7.3).
7.3: "One of my questions was partly mistaken," but by the same test question 3 was too.	C1, C3	Accepted. Fixed in revision 65. Question 3 said the right angle was "not explained," and the argument was on the page, split across two steps. Two of my questions were partly mistaken: 3 and 5.
5.3 and 5.4: question 7 counted as exposing a defect, although at 07:45 Claude had listed the three results "cited, not proved."	C1	Answered. Question 7 exposed the inconsistency itself: some steps proved in full, others asserted. The 07:45 reply named three cited results; it did not name the inconsistency.
7.3: "Section 5 shows one way to meet them" cannot show requirement 4.	C1, C3	Accepted. Fixed in revision 65. Section 5 shows requirements 1 to 3 being met for one problem and one questioner. Requirement 4 can only be shown over time.

Finding	Raised by	Answer
5.4: "the questioning led to a proof that states where it uses the parallel postulate," but that statement came later.	C3	Accepted. Fixed in revision 65. Appendix A, including A.11, was completed through further questioning during the writing of the paper.
5.4: "which the first answer used without saying so."	C2	Accepted in part. The first answer used the angle sum of a triangle and similar triangles. Euclid proves the angle sum in Elements I.32, using I.29, and the Book VI propositions on similar triangles using VI.2, which Appendix A.11 says depends on I.29. These are claims about Euclid's text; Ref. 10 lists Book VI, Propositions 1 and 2, which A.11 uses, but not I.32 or the similarity propositions, such as VI.4. That is the sense of "used"; the withdrawn claim in Appendix D was the stronger one, that Thales' theorem "cannot be proved" without the postulate. "Without saying so" means without saying that they depend on the fifth postulate (record 4.3).
5.4: A.3 to A.10 do not name A9 and A11 as where the postulate enters; A.11 does.	C1, C3, C4	Accepted. Fixed in revision 65: Section 5.4 now names A9 and A11 and points to Appendix A.11.

Finding	Raised by	Answer
7.4: Fallis's untraversed gap does not fit a reader who just believes a formal proof.	C1, C2, C4	Accepted. In my reading of Fallis, a reader who reads an autoformalized proof and accepts it without verifying each step holds a particular sequence "in mind (as being a proof)," which is Fallis's untraversed gap; a reader who does not read it holds no sequence in mind, and a gap that no one has checked is what Fallis calls "universally untraversed" (page 47). Fixed in revision 76: Section 7.4 now draws this distinction.
3: "A false step here is close to his inferential gap."	C4	Answered. A false statement in a proof makes the sequence "not a proof," which is Fallis's inferential gap. The converse is not claimed; "close to" says so. Section 3's false step also covers false statements about a proof, such as a source cited for what it does not say; those have no counterpart in Fallis's inferential gap, which is another reason the paper says "close to."
4.2: "neither account covers," "neither uses."	C1, C2, C4	Answered. These are claims about the two papers as published. I read both in full; the page numbers are given for checking.
4.2: the reader is not fixed, because the presenter chooses the foundation by audience.	C2	Answered. The presenter chooses how deep the foundation goes. Once it is stated, the reader supplies nothing above it, whoever the audience. In Krabbe and Dutilh Novaes the audience decides how much detail a proof needs (Section 4.2: "sufficiently detailed for the intended audience"). "Above the foundation" is my framing.

Finding	Raised by	Answer
7.2: "They give no test for it."	C2	Answered. A claim about the Group's recommendations, which I read in full (Ref. 2).
7.1, row 5: "Section 9.1, item 5 adopts it," but item 5 omits failures and how problems were chosen.	C1, C3, C4	Accepted. Fixed in revision 65. Item 5 adopts a record at release of how AI came to be used on the problem. It does not adopt the Group's request for failures and for how problems were chosen.
9.1, item 4: the Group "asks for" comments, where 7.1 says "ideally."	C2	Accepted. Fixed in revision 65. The Group asks for a repository that records changes, ideally one that allows comments.
9.1, item 4: Grcar's "often caught" against "especially rare."	C2, C4	Accepted. Fixed in revision 65 by a correction of wording. Grcar: "many of the substantive errors are found through (2) reader comments, which are especially rare in mathematics" (Ref. 18, page 419). In my reading of the sentence, across fields many errors are found through comments, and in mathematics comments are rare. That rarity is the reason for item 4.
9.2 omits item 3 from what the Group already asks.	C1, C3	Accepted. Fixed in revision 65. The Group names a responsible mathematician for course 2.A, which is part of item 3.
9.3: Gowers describes "the same exchange."	C1	Accepted in part. Fixed in revision 65. Gowers describes a reader working through a paper actively with an LLM's hints; the paper's process is a reader questioning until each step is answered. They share the active reader, not every feature.

Finding	Raised by	Answer
C.1: the priority claim for "every question" is broader than 4.2 supports.	C1	Answered. Krabbe's proposal follows through "all the possible dialectic options for that person." Mine is every question from anyone, whatever its tone or validity, including where the result came from, for as long as it is in use. Section 4.2 lists these differences.
C.3, July 2026: "thirteen places" cannot be checked.	C3	Accepted. The record of that exchange is not in this paper, and since revision 65 Appendix C.3 says so.
C.3, Draft v5 entry: "This draft corrects them," but other claims in Appendix D stand without notes.	C2, C1, C3	Accepted. Fixed in revision 65. The notes cover the claims the reviewers identified as withdrawn. Other claims in Claude's replies stand as recorded, and the paper does not endorse them. They include "it isn't a weak spot you can engineer away" and "This is where the 180° in Thales' theorem comes from", "Two results cannot be proved at this level," "a limiting argument," and "Deriving it from Euclid's own wording needs Euclid I.16 and I.27." The paper's own claims about the parallel postulate are in Appendix A.11.
Appendix D, 07:23: "the word 'independent' was false" rests on the unproved claim the note flags.	C1	Accepted. Fixed in revision 65. That sentence stands with the claim the note says is not proved.
Section 5 limits what one case shows, yet the Abstract and Section 10 present it as the standard "at work."	G2, G3	Answered. The Abstract says it shows the standard at work on one problem; on my reading, Section 10's demand rests on Sections 4 and 6 to 9, not on the case.

Finding	Raised by	Answer
Section 6 table does not separate what Section 5 showed from what holds only where adopted.	G2	Accepted. The table states what the standard supplies; the line above it says rows relying on the record mean the standard as adopted. None of the rows is shown by Section 5 alone.
6.3: "would be owed an answer" is a counterfactual.	G2	Answered. It states what the standard requires, not a fact about those episodes.

3.4 Appendix A

Finding	Raised by	Answer
A3(c), A3(d) and A5(b) are written with fixed letters but used for other points (L3 step 5, L4 step 6, L6 step 3).	G2, G3	Accepted. Fixed in revision 65. The items of the foundation are general: their letters stand for any points that meet the stated conditions. For example, A3(d) says: if a point O lies between points A and T, then ray AO is ray AT. In L6 step 3, D = T, or D lies between A and T, or T lies between A and D (definition of ray, and A3(a) and A3(e)); the case D = T needs nothing; D between A and T gives ray AD = ray AT by A3(d); T between A and D gives ray AT = ray AD by A3(d) with O replaced by T and T by D; B between A and C gives ray AC = ray AB (A3(d)), and ray AE is ray AC by the same three cases for E: E = C needs nothing; E between A and C gives ray AE = ray AC by A3(d); C between A and E gives ray AC = ray AE by A3(d) with O replaced by C and T by E. Fixed in revision 76: L6, step 3 writes out the cases. Revision 77 cites A3(e) for the order of the points, and revision 78 sets apart the cases D = T and E = C, which need no item.
L3, steps 2 and 3: the triangles OAB and OBT are not justified inside the general lemma.	C1, C2, C3, C4	Accepted. Fixed in revision 65. For any B meeting L3′s hypotheses: O lies between A and T, so O is on line AT and differs from A and T (A3(e)); line OA and line OT are line AT (A2); B is not on line AT; so O, A, B and O, B, T form triangles.

Finding	Raised by	Answer
A.2, given 2: AT = AO + OT uses AO = OA.	C1, C2, C3	Accepted. That the distance from X to Y equals the distance from Y to X is assumed with A4. Fixed in revision 65: A4 now lists it.
A10 says "the line through P parallel to QR," which presumes a single parallel.	C2, C4	Accepted as wording. Fixed in revision 65: A10 now says "a line through P parallel to QR." Both conclusions of A10 hold for any such line, and L2 uses it that way. Uniqueness of the parallel is not assumed anywhere.
A.11's claims about A10 and about Euclid's dependencies are asserted.	C1, C2, C3	Accepted. Fixed in revision 65 for A10. A10 is assumed, not derived, so the claim that it does not depend on the postulate is not shown on the page. The claims about Euclid rest on Ref. 10, which the reader can check. No step of the derivation of r depends on A.11.
A.12, item 5: "they lie on one line (A12)" needs that each solution set is a line.	C3	Accepted. Fixed in revision 65. Collinearity follows directly from B lying between A and C (A3(e), which coordinates satisfy by A12).
A.12, items 2 and 6 do not state that T is on the large circle and C on the smaller one.	C4	Accepted. Fixed in revision 65. $0^2 + (0 - r)^2 = r^2$, and $(c - c)^2 + (0 - s)^2 = s^2$. Since revision 81, items 2 and 6 cite the definition of circle, A12 and A1.

Finding	Raised by	Answer
L4, step 5 does not show O, F, T and O, F, T′ are triangles.	C2	Accepted. Fixed in revision 65. O is not on the ground line (step 1), and F, T and T′ are distinct points on it (F ≠ T by supposition, T′ ≠ F since FT′ = FT > 0 by A4, and T′ ≠ T by step 3), so neither triple lies on one line (A2: the only line through two distinct points of the ground line is the ground line). Since revision 73 this reason is in step 4, and since revision 75 step 4 cites A2 for it.
L6, step 7 does not cite A5(c); L2, step 1 does not cite the sides clause of A3(b) the second time.	C1, C4	Accepted. Fixed in revision 65. Both are missing citations.
The foundation omits references, though Section 3 asks for one "where one exists."	C2, C4	Accepted. Fixed in revision 65 for A8. A8 is Euclid, Elements I.31. For the rest: A1 is about real numbers, A2 about lines, A3 about order, A4 about length, A5 about angles and A7 about perpendiculars. Hilbert's Grundlagen der Geometrie (1899) is a reference for A2 and A3: David Hilbert, Grundlagen der Geometrie (Leipzig: Teubner, 1899), translated as The Foundations of Geometry (Chicago: Open Court, 1902). Fixed in revision 75: the paper cites it as Ref. 20 in A2 and A3. A1, A4 and A5 are textbook facts of real numbers, length and angle measure, and A7 of perpendiculars; I have not found one source that states them in this form, so the paper gives no reference for them. A10 and A12 are assumed here and have no reference.

Finding	Raised by	Answer
Definitions used without being named (A.2); "crosses" in A9 undefined.	C1, C3	Accepted. Fixed in revision 65. A line crosses two lines when it meets each at exactly one point.
Symbols reused: c in A12 and A.12, r as an angle in L2, Q in L1, L2 and A.12.	C2, C3, C4	Accepted. Fixed in revision 65 for c, which is now k in A12. The rest is local: r names an angle only inside L2, and where L2 is applied its point letters are replaced by the points it is applied to, and its angle names p, q and r are local to it.
The figures in A.12 ($s < r$, the expansions in item 8, the decimals) are not derived from A1.	G3	Accepted for $s < r$: A.12, item 1 gave no reason. It is $s = 3r/7 < r$, since $r > 0$. Fixed in revision 73. The rest does not hold. A1 assumes "the usual arithmetic." The expansion in item 8 uses $c^2 = 120$ and $r^2 = 70$: $16r^2/(49c^2) = 16 \times 70/(49 \times 120) = 4/21$. The decimals in item 4 (58.8 and 11.2) are exact. The "about" values (8.37 cm and 3.59 cm) are approximations for the reader, and no step uses them.
L2, step 1 does not show that M and N are on opposite sides of line PQ.	G2	Accepted. A3(b) needs that neither M nor N is on line PQ, and for that the step needs that M and N differ from P, which follows from A3(e), since P lies between them. Fixed in revision 80.

3.5 Reader problems

Finding	Raised by	Answer
Section 7.2 is headed "fully understands" but tests "take full responsibility."	C1, C2, C3, C4	The test is my working meaning of "fully understands," stated through the Group's own norm of taking full responsibility. Since revision 64 it requires answering from one's own understanding.
"This draft" in Appendix C.3.	C1, C2, C3, C4	Each "this draft" meant the draft that followed the one named in that entry. Fixed in revision 65: each entry now names the draft.
Times attached to Claude's replies.	C1, C2, C4, G2	Each of Claude's replies is referred to by the time of the message it answers. Fixed in revision 65, and reworded in revision 76: Appendix D's introduction says so.
Section 5.1 does not say the AI system is Claude.	C4	It is Claude, made by Anthropic (Appendix C). Fixed in revision 65.
Section 5.3, row 4: "the fact the proof rests on" against the plan's three key facts.	C4	Fixed in revision 65: it read "the facts the proof rests on." Revision 77 changed it to "the key results the proof rests on" (record 4.3).
Section 6 table and 6.1 send the reader to 6.5 for how insight is built.	C2, C3	Accepted in part. Fixed in revision 65. Section 6.5 covers digestion, which is where the paper places the community's further work on a result; it does not describe how insight is built.
Section 7.1 has two rows labeled "2."	C1, C2	Both are parts of the Group's item 2.

Finding	Raised by	Answer
"MIT Technology Review"; "Git"; "chain of thought"; Lee's Theorem 1.2 and Proposition 3.1.	C1, C2, G1	MIT is the Massachusetts Institute of Technology. Git is software that records the history of changes to files. A chain of thought is the text a model produces while working toward an answer. Theorem 1.2 and Proposition 3.1 are numbered results in OpenAI's report, as Lee discusses them (Ref. 7). Fixed in revision 65 for MIT, Git and chain of thought.
Córdoba and Martínez-Zoroa; "transcripts."	G1	They are the mathematicians whose approach both Navier-Stokes proofs use (Ref. 8). The transcripts are, in Section 6.3's words, "the transcripts of his work with Alpöge."
"Clearly," "by conjugacy," "Laplace's principle then gives" have no context.	C3	Answered. They are general examples of a sentence that asserts where it should argue, not quotations from any particular proof. The paper attributes them to no source because it claims none.
"The most important sentence" of the Group's recommendations is not identified.	C3	Accepted. The paper does not identify it. It is the sentence Section 4.2 quotes: authors of important work "regularly give seminars at other institutions and talks at conferences, explaining their new developments and answering questions from colleagues" (Ref. 2). The summarized version of the page left it out; the full text, which I then supplied, contains it. It matters most because it states the duty to answer as an existing norm of the field.

Finding	Raised by	Answer
Appendix D: "a Facebook audience."	C1, C2, C3, C4	Answered. The phrase is Claude's, in the reply recorded at 07:47, and Appendix D reproduces replies as written. Nothing in the paper depends on it. The reply offered a choice of how deep the foundation should go; I chose the deeper option at 07:48. What the standard fixes is not the audience but that the reader supplies nothing above the stated foundation (Section 4.2).
Appendix D: "Hilbert-style order axioms."	C2, C3, C4	David Hilbert's axioms of order for geometry (Grundlagen der Geometrie, 1899), which make betweenness precise. The paper cites it as Ref. 20 since revision 75.
Appendix D: "Euclid I.16 and I.27."	C4	Propositions of Book I that Claude's reply named. They are not in Ref. 10, and the paper does not rely on them.
Appendix D: "the way we did the squares."	C4	The squares problem of Section 5.5.
Appendix D's labels, and F1 to F6 at 07:47, differ from Appendix A's.	C1, G3	The note in Appendix D's introduction says so. F1 to F6 are that reply's own labels, and the 07:47 table gives what each stands for. In Appendix A's terms, F1 is A6 (side-angle-side), F2, the angle sum stated as a form of the parallel postulate, is withdrawn by the note in the 07:47 reply (Appendix A proves the angle sum as L2), F3 is A5(a), F4 is replaced by A4 in Step 0, item 6, F5 is A7, and F6 (similarity) is replaced in Appendix A by A11 and L6.
Course 2.A and 2.B are used densely in Sections 7 and 8.	G2	They are defined at the start of Section 7.

Finding	Raised by	Answer
Section 5.3 does not restate the clock times for questions 3 to 7.	G2	Appendix D gives them: 07:30, 07:31, 07:43, 07:45 and 07:47.
Andersen is cited by reference number in 4.1 and by surname in 4.3.	C1	Line Edslev Andersen, Refs. 15 and 16. Fixed in revision 65: Section 4.3 gives the full name.

Part 4. Answers to the reviews of revisions 65 to 68

Findings already answered in Parts 2 and 3 and raised again here are listed by subject only, with a pointer. Labels are as in the table at the top.

4.1 Repeats of findings answered above

Finding	Raised by	Where answered
My proposals in Sections 4.3, 6.5 and 7.2, and the Section 6 table's proxy row	G5, C8	3.1. Each is labeled as my proposal or reading where it is argued.
4.2: "neither account covers," "neither uses"	C5, C6, C7, C8	3.3
1.1: "OpenAI denies it"	C6, C8	3.3. Ref. 8: "OpenAI has denied the accusations."
7.4: Fallis's untraversed gap applied to readers of formal proofs	C5, C6, C7	3.3
3: "A false step here is close to his inferential gap"	C5	3.3
Consequence 1: disagreement "can be resolved," and pointing to the page as an answer	C6, C7, C8	3.2
7.5: answering is not directing	C6, C7, C8	3.1
7.6: no access to the model	C6, C8	3.1

Finding	Raised by	Where answered
7.2 and 8.3: who holds the duty for a course 2.B result	C5, C7	3.2
5.3, question 1, against Appendix B	C7, C8	3.3
C.1: what the ideas I claim are	C6, C8	3.3. Section 4.2 sets out what is Krabbe′s and Dutilh Novaes′s; Section 4.1 credits Andersen (Ref. 15) with the observation that checking continues after publication. What I claim is what C.1 lists: "that the duty to answer meets the declaration′s complaints, that it covers every question whatever its tone, critique or validity, that it applies to everyone, and that it continues after publication."
The case study shows one problem, and the Section 6 table rests on adoption	G4, G5	3.3
The Appendix D introduction, two label systems	G4, G5	3.5. Since revision 67 the introduction says that, of the last reply′s labels, only A1 to A7 differ from Appendix A′s. It also says that F1 to F6 in the 07:47 reply are that reply′s own.
"A Facebook audience," "Hilbert-style order axioms"	C7, C8	3.5
L2 uses r for an angle	C7, C8	3.4

Finding	Raised by	Where answered
References cannot be checked from the paper	G4, G5	Refs. 1 to 9 and 11 have links. Refs. 12 to 15 and 17 to 19 are journal articles, cited by journal, volume and pages. Ref. 10 is Euclid, cited by proposition. Ref. 16 is a handbook chapter, cited by editor, publisher and pages. Ref. 20, added in revision 75, is Hilbert's book, cited by publisher and year, with its translation. Refs. 21 and 22, added in revision 83, have DOIs. The AIGS standard itself says "DOI: to be assigned upon publication"; its DOI is the one Ref. 23 gives for it. Ref. 23 has an arXiv link since revision 84.

4.2 Gaps in the argument

Finding	Raised by	Answer
Section 10 states as fact that a record of answering "earns experts their latitude," which Section 4.3 labels my proposal.	C5, C6, C7, C8	Accepted. Read "under the field's convention as I read it (Section 4.3)," as Section 4.3 has it. Fixed in revision 73.
4.3 moves from the expert being able to answer to a record of answering.	C8	Accepted. The step is not in Section 4.3. Readers grant latitude on the expectation that the expert can answer. A record of answering is the evidence for that expectation, and AI output has none yet. Section 4.3 labels the claim my proposal, and this step is part of it.
7.2: when a pending question counts as "left unanswered."	C5, C7	Accepted. The paper sets no time. A question is left unanswered when the presenter declines it or stops answering it.

Finding	Raised by	Answer
5.3, question 2, "Nothing new": the 07:23 reply had its own unproved step (OF < OT).	C5, C7	Answered. Each row credits what came to light in answering the question. Answering question 2 brought out nothing beyond Claude's own list at 07:23; the OF < OT step was dropped in the 07:25 rebuild, not found.
5.3, question 3, "No new defect": the 07:25 argument used results not listed in a foundation.	C7	Answered. Those unlisted results were exposed by question 6, and the table records them there. Question 3 asked why the right angle held, and the argument for it was on the page.
8.1: "The standard names the condition it depends on."	C7	Answered. The sentence before it reads "I read Nguyen's first point as describing that situation," so it is part of that reading.
2.1: "None of the five says the results are false" and "It proposes no standard."	C6, C7	Answered. These are claims about the declaration, which I read in full (Ref. 1).
7.3: the case shows one questioner, the author, and the AI drafting answers.	C5, C6, C8	Accepted. Section 5 shows the method with one questioner. That a presenter meets requirement 3 for other people's questions can be shown only over time.
7.3 states as the method what C.4 says was not always kept.	C5	Answered. Section 7.3 describes the method; C.4 says it was not always kept, and C.3 lists where.

4.3 Claims larger than their evidence

Finding	Raised by	Answer
C.3 credits Dutilh Novaes with "to any depth," but the quotations from her in 4.2 do not show depth.	C6, C8	Accepted. In Krabbe, proofs are "developed to great dialectical depth," and Dutilh Novaes's Skeptic may "request for further clarification whenever Prover moves too quickly" (Ref. 14, page 2619). Neither says "any depth" in those words; Krabbe's proposal that "all the possible dialectic options for that person must be followed through" (Section 4.2) comes closest. Fixed in revision 75: Appendix C.3 now says "in depth."
5.4: which Euclid propositions give the angle sum and similar triangles.	C5, C8	Accepted. Section 5.4 names no proposition; they are these. The angle sum is Elements I.32, whose proof uses I.29. The similarity propositions of Book VI, such as VI.4, use VI.2 in their proofs. Ref. 10 lists Book VI, Propositions 1 and 2, which A.11 uses, but not I.32 or the similarity propositions, such as VI.4.
5.4: "without saying so," although Appendix B states the angle sum and the similarity.	C6, C8	Accepted. It means without saying that they depend on the fifth postulate.
5.3, question 7: "every other step proved," but the 07:48 reply admits two things not done at full rigour.	C7	Answered in 3.3. The column records what the answer had to add; Appendix A is the version that adds it.
5.3, question 5: the naming changes were proposed at 07:43, and L6 at 07:48 cites "L3."	C8	Answered. The column says what the answer had to add. The 07:48 page names Thales' theorem in L3's heading and cites it as L3 later. L3 is the theorem's name in the proof, and the later step that uses it cites L3.

Finding	Raised by	Answer
5.3, question 4: "the facts the proof rests on appeared only when they were reached," though the 07:25 figure opened with a Given step.	C7	Accepted. What appeared only when reached were the key results: Thales' theorem, the radius meeting the tangent at a right angle, and similarity. Fixed in revision 77: row 4 now says "the key results the proof rests on" (record 5.3).
5.6: Lee "wrote the added detail himself," though he worked with an AI.	C6	Answered. He wrote the added detail himself, and Section 5.6 also records that he asked an AI "about the intuition and choice of parameters in the proof."
The header and C.3 refer to a review record the reader cannot see.	C8	Answered. This is that record.

4.4 Appendix A

Finding	Raised by	Answer
L2, steps 2 and 3: "crosses" is not shown for line PQ with QR, or for line PR with m and QR.	C5, C6, C7, C8	Accepted. P is not on line QR, so line PQ is not line QR, and they meet only at Q (A2). R is not on m, since m does not meet QR, so line PR is not m and meets it only at P (A2). P is not on line QR, so line PR is not line QR and meets it only at R (A2). Q is on line QR, which m does not meet, so Q is not on m; so line PQ is not m and meets it only at P (A2). In each case A2 gives "only": two distinct lines cannot share two points, since through two distinct points there is exactly one line. Fixed in revision 73.

Finding	Raised by	Answer
L4, step 4 uses ∠OFT before step 5 shows that O, F, T form a triangle.	C8	Accepted. Step 5′s reason (O is not on the ground line, and F, T are distinct points on it) belongs in step 4. Fixed in revision 73.
L4, step 4 uses A5(b) without saying that line TT′ is the ground line.	C6	Accepted. T and T′ are distinct points of the ground line, so line TT′ is the ground line (A2). Fixed in revision 73.
L4, step 3: "Then T′ ≠ T" cites nothing.	C7	Accepted. F lies between T and T′, so they are distinct (A3(e)). Fixed in revision 73.
L1 compares a triangle with itself, and A6 speaks of two triangles and their correspondence.	C5, C6	Accepted. The matching is the one named in the step: P to P, Q to R, R to Q. A6 spoke of two triangles and did not say that it applies to one triangle with its corners read in two orders. Fixed in revision 71: A6 now covers that case.
L3′s closing paragraph omits given 2; A.10 item 1 omits given 4; A.3 item 6 needs A2 and A ≠ T; A.3 item 5 needs B ≠ C and A2.	C5, C6, C8	Accepted in part. A.3, item 5 already cites A2, and item 4 shows B ≠ C. The others are missing citations, and each fact is on the page. Fixed in revision 73. Revision 74 also added to item 5 the citation of item 4, and of given 4 with A2.
A.12: item 4 does not go from $OB^2 = r^2$ to OB = r; item 1 gives no reason for s < r.	C8	Accepted. Since revision 74, A.12 takes each distance as the positive square root (A12 and A1): OA = OT = r in item 3 and OB = r in item 4, since r > 0; AC = 20 in item 5; and QB = s in item 7, since s > 0 (item 1). s = 3r/7 < r because r > 0. Fixed in revisions 73 and 74: items 3, 4 and 7 now take the positive square root (A12 and A1), and item 5 cites A12 and A1 for AC = 20, and item 1 gives s < r.

Finding	Raised by	Answer
A12 defines no angle measure, so "satisfy A5, A6, A9 and A10" is undefined; Section 5.4 says "the whole foundation," A12 says "A1 to A11."	C5, C7	Accepted. A.12 cites A12 and A3(e). It also uses A1 for the arithmetic and the positive square root, A2 for the ground line, and the definitions of circle, opposite and touching. Since revision 74, item 1 shows that the ground line, the line through T and C (A2), is y = 0; T and C are distinct: TC = √((0 − c)² + (0 − 0)²) = c > 0 (A12; A1, since c = √120 > 0), and the distance from a point to itself is 0 (A4), and items 3, 4 and 7 cite A12 and A1 for the positive square root, and item 5 cites them for AC = 20. A.12's own steps use none of the angle items. A.12 builds the configuration in coordinates, and its closing paragraph, "by A.10 no other value of r is possible," covers that configuration only if the coordinates satisfy the whole foundation, since A.10 rests on L1 to L6, which use A5, A6, A9 and A10. So A12 does need to assume the angle items, and it does. What it lacks is a definition of angle measure: the measure of ∠XYZ is the angle between 0° and 180° whose cosine is ((X − Y) · (Z − Y))/(XY × ZY). That the coordinates then satisfy A1 to A11 is assumed, as A12 says. Read Section 5.4 as "A1 to A11." Fixed in revision 73: A12 now gives this definition. Fixed in revision 74: Section 5.4 now says "A1 to A11."
"The lemmas are general," but L4 and L6 rest on the problem's givens.	C7, C8	Accepted. L4 and L6 state no conditions; they are proved for the configuration of A.2 and Step 0. Fixed in revision 71: Appendix A's introduction now says so.

Finding	Raised by	Answer
"Step 0" and "The answer" in Appendix A against the scope in Section 3.	C8	Accepted. "Step 0" is a section label, like the figures' "Steps," and Section 3's list of ordinary senses should include it. A.10's "answer" supplies the fact the problem asks for. Fixed in revision 73 for "Step 0" and in revision 76 for "The answer."
Foundation items without references; Section 9.1, item 1 asks for a reference for each; the foundation also holds definitions.	C5, C6, C7, C8	Accepted, as in record 3.4. Section 9.1, item 1 should read "with a reference where one exists," as Section 3 does, and should also ask for every definition the proof relies on, as requirement 1 does. Fixed in revision 73.

4.5 Reader problems

Finding	Raised by	Answer
"Understanding" sits under "The duty does not depend on the question."	C5, C6	Accepted. It is a condition on the presenter, not on the question.
Section 5.6's "main theorem" against Section 7.4's "Theorem 1.2, one of its two main results."	C5, C6, C8	Accepted. In OpenAI's report, as Lee discusses it (Refs. 6 and 7), the two main results are Theorem 1.1, on the optimal Cohn-Elkies linear program, whose upper and lower exponents agree, and Theorem 1.2, on the sign-uncertainty constant, half of which is not formalized (Section 7.4). The names "Theorem 1.1" and "the sign-uncertainty constant" are Ref. 6's; the paper uses neither. Fixed in revision 71: Section 5.6 now says "one of the report's two main results."

Finding	Raised by	Answer
5.6: "They describe no exchange with OpenAI," beside Lee's conversation with ChatGPT.	C5, C6, C8	Answered. OpenAI the company is the presenter; ChatGPT is its product, and the presenter is never the AI itself (Section 3).
Cohn and Miller (2016) is not in the References.	C5	Accepted. It is cited only through Lee (Ref. 6).
"Each reply carries the time of the message it answers," though replies are headed "Claude."	C5, C6, C7	Accepted. Fixed in revision 76: Appendix D's introduction now says each reply is referred to by the time of the message it answers.
Question 2 and question 7 as questions; the 07:48 message not counted.	C7, C8	Answered. Question 2 demands the skipped steps, and question 7 objects that some steps are asserted, not proved; both ask for reasons. The 07:48 message chose an option Claude offered. Its "Tell the truth!" asks that the answers be true, not for the reason behind any part of the result, so it is not counted as a question.
7.4: "Checking the second is itself a question."	C7, C8	Accepted. The question is "Why is the formal statement the paper's statement?"
"Foundation" in 7.4 means a formal proof's axioms and libraries.	C7	Accepted. That is the ordinary sense, not Section 3's. Fixed in revision 75: Section 3 now says so.
The Abstract uses the idea of a presenter before Section 3 defines it.	G4, G5	Accepted. The Abstract says "whoever presents it," the core of Section 3's definition; Section 3 gives all of it.
5.3 does not give the time of question 3 (07:30).	G4, G5	As in 3.5: Appendix D gives it.

Finding	Raised by	Answer
5.3, row 1, lists two gaps; the 07:23 reply listed more.	C6, C19	Accepted. The 07:23 reply also named the compressed Step 1 and the unargued "AT ⊥ line." The row lists the gaps in the caption and in the check, which the 07:25 answer dealt with: it gave the correspondence and dropped the check. Fixed in revision 82: row 1 now lists the two other breaks.
Section 5.3 refers to "the tangent-secant rule" without stating it.	C6	Accepted. It is $CT^2 = CB \times CA$ (Appendix B).
The header says revision 68, and C.3 says the accepted findings were corrected in revision 65.	C7, C8	Accepted. Revisions 66 to 68 fixed the Part A findings record A4 to A7. Fixed in revision 70: Appendix C.3 now says the seven Part A findings were each fixed by revision 68.
Section 9.1, item 3: "a person or team"; Section 3: "the person or organization."	C7	Accepted. Section 9.1, item 3 should read "a person or organization," as Section 3 does. Fixed in revision 73.
"Severely misaligned" is in quotation marks with no quoted passage containing it.	C7	Answered. The declaration says: "The goals of the AI companies and the goals of the mathematical community are severely misaligned" (Ref. 1). The paper quotes the phrase from that sentence, as any quotation of a phrase does; the reader checks it at the source.
5.2: "three steps and an 'independent check'" against Appendix B's view numbered 4.	C8	Answered. The fourth numbered view is the check.
The 7.1 table's item numbers can be confused with courses 2.A and 2.B.	C6	Accepted. The rows are the items of the Group's Step I.

Part 5. Reviews of this record

Up to revision 82, this record was itself reviewed fifty times, with the same two-part brief, applied to the record and checked against the paper: twenty-five reviews by fresh Claude agents (C9 to C33) and twenty-five by Grok (G6 to G30), from revision 69 to revision 82. The table at the top gives the revision of the paper each review used. The reviews ran in rounds of one Claude review and one Grok review. Where the paper did not change between rounds, the later round reviewed a corrected version of this record against the same revision.

5.1 What the reviews of this record changed

Where a review showed that a row of Parts 1 to 4 was wrong, the row was corrected in place, so that each row now gives the answer that stands. The corrections included these kinds:

- a quotation, count, label or revision number that did not match the paper, corrected to match it;
- a description of what a revision changed, corrected to what the paper now shows;
- a reading of the paper or of a source that had been stated as fact, now marked as my reading;
- a label that did not fit its answer, such as a row marked Answered whose finding held, relabeled;
- an answer about Appendix A that left out a step, with the step written out.

Where a review showed that the paper itself was wrong or incomplete, the paper was corrected in a new revision; record 5.3 lists those revisions. Earlier versions of this record carried a log of the corrections made to the record. This version keeps the corrections and drops the log.

5.2 Findings about this record that recurred

Some findings were raised by many reviews. Each is answered here once.

- **Quotations from sources the paper does not quote** (for example Ref. 8, "OpenAI has denied the accusations"; Ref. 14, page 2619; Grcar's full sentence on page 419 of Ref. 18). These cannot be checked from the two documents alone. They are checked at the source, as any citation is, and each was checked against its source.

- **Claims that a source contains nothing of a kind** ("neither account covers," "They give no test for it," "None of the five says the results are false"). Absence cannot be shown by quoting. These rest on my reading of each source in full. The references let anyone check them, and a passage to the contrary would be a question to answer.
- **Claims about Euclid's Elements** (I.32 and I.29 for the angle sum; VI.2 in the similarity propositions, such as VI.4). These are claims about Euclid's text that go beyond the propositions Ref. 10 lists, and they are checked in the Elements. No step of the derivation of r depends on them.
- **The PDF.** The PDF export of the paper shows Figure 1 and the page break that Part 2 refers to. The markdown export shows Figure 1 only as a placeholder.
- **Pointing to a step that is already on the page.** A question that asks for such a step is partly mistaken (Section 5.4). Pointing to the step shows where the mistake lies and supplies the step the questioner asked for.
- **Reviewer G4.** The file G4 reviewed could not be identified more closely than revision 65 or 66. Each G4 finding is answered in the row that names G4.
- **Reviewers G12 and G13.** They put nothing in Part A, and their Part B findings repeated findings answered here or in Parts 3 and 4.

Every other finding about this record concerned a row of Parts 1 to 4, and either led to a correction of that row or is answered by the row as it now stands.

5.3 Corrections to the paper

By the paper's definition (Section 3), a false step is "a false statement in or about a proof: a result invoked wrongly or outside its hypotheses, a source cited for something it does not say, or a false description of the proof itself." In my reading, since the paper is published under its own standard, its own statements are held to it as a proof's are. At least seven findings this record had accepted were of that kind. Other findings corrected in revision 65, such as "an answer" in the Abstract and the count of mistaken questions in Section 7.3, may be of the same kind. Revision 65 had corrected three of them: the record 3.3 rows on Section 7.1, row 5; on Section 9.1, item 4 (the "asks for" row); and on Section 9.3 (Gowers). Revision 71 corrected three more, and revision 77 the seventh (below):

- **Appendix A's introduction** said the lemmas are general. L4 and L6 are proved for the configuration of A.2 and Step 0. It now says that L1, L2, L3 and L5 are general, and that L4 and L6 are proved for the configuration of A.2 and Step 0.
- **Section 5.6** said "the report's main theorem is that they agree." The report has two main results. It now says "one of the report's two main results is that they agree."

- **A6** spoke of two triangles, and L1 applies it to one triangle with its corners read in two orders. A6 now reads: "If two triangles, or one triangle with its corners read in two orders, have two sides and the angle between them equal, they are congruent: all their corresponding sides and angles are equal."

Apart from these three corrections and the revision number in its header, revision 71 changed nothing. Revision 72 added a sentence to the Draft v6 entry of Appendix C.3 that gave the count as three; revision 73 corrected it to six. Revision 73 also carried out in Appendix A most of the steps this record had accepted as missing (L2, steps 2 and 3; L3's closing paragraph; L4, steps 3 to 5; A.3, item 6; A.10, item 1; A.12, items 1, 3, 4, 5 and 7; and the definition of angle measure in A12), and corrected four places where the paper did not match its own definitions or labels: Section 3 now names "Step 0"; Section 9.1, item 1 asks for a reference where one exists and for every definition; Section 9.1, item 3 says "a person or organization"; and Section 10 says "under the field's convention as I read it." Revision 74 carried out the steps a review of revision 73 found still missing: in A.3, item 3, the citation of given 1; in items 5 and 7, given 4 and A2; in item 5, item 4 for "distinct"; in L4, step 3, that FT > 0 and that T′ is the other of the two points A4 gives; and in A.12, item 1, that the ground line is y = 0. It also cited A12 and A1 for the positive square root in A.12, and changed Section 5.4 to "A1 to A11." Revision 75 cited A2 in L4, step 4, for why O, F, T and O, F, T′ form triangles; added Hilbert's Foundations of Geometry as Ref. 20 and cited it in A2 and A3; added to Section 3 that in Section 7.4 "foundation" also means a formal proof's axioms and libraries; and changed "to any depth" in Appendix C.3 to "in depth." Revision 76 wrote out the three cases for E in L6, step 3; changed Appendix D's introduction to say that each reply is referred to by the time of the message it answers; added to Section 3 that A.10's heading, "The answer," names the value the problem asks for; and in Section 7.4 applied Fallis's untraversed gap to a reader who reads an autoformalized proof and accepts it without checking each step, and his term "universally untraversed" to "a gap that no one has checked" (Section 7.4). Revision 77 corrected a seventh false step: Section 5.3, row 4 said "the facts the proof rests on appeared only when they were reached," though the 07:25 figure opened with a Given step; record 4.3 had accepted the finding, and the row now says "the key results the proof rests on." Revision 77 also cited A3(e) in L6, step 3, for the order of the points, and changed the count in Appendix C.3 to seven. Revision 78 changed it to "at least seven," and that sentence now says "had not listed as false steps" in place of "had filed as gaps." Revision 78 also separated, in L6, step 3, the case D = T (and E = C), which needs no item, from the two cases that A3(d) gives. Revision 79 restricted the identity in A.12, item 5 to (u, v) other than (0, 0), since A1 gives no square root of 0; item 5 applies it only to C − A = (c, −2r). Revision 80 added to L2, step 1 that M and N differ from P, since P lies between them (A3(e)). Revision 81 cited A1, with

the definition of circle and A12 where they apply, in A.12, items 2, 5, 6 and 8, and stated in A.12's opening that equal squares of numbers that are not negative give equal numbers. Revision 82 cited A1 for c > 0 and r > 0 in A.12, item 1, item 1 for r > 0 in items 3 and 4, the definitions of opposite and touching in items 3 and 8, and A1 for $u^2 + v^2 > 0$ in item 5, and added to Section 5.3, row 1 the two other breaks the 07:23 reply listed.

Part 6. Revision 83 and later

This part answers the findings about the paper made by the reviews of revision 83 and later, which are listed in the table at the top. G31 found nothing. C52 and C53 raised no finding about the paper that is not answered in a row below. Revision 83 added three earlier documents as precedents (Refs. 21 to 23). Findings about this record were corrected in place, as in Part 5.1, unless a row below answers them.

Finding	Raised by	Answer
Section 4.2 said the Leiden Declaration "asks"; it says that mathematicians "have a responsibility to."	C34	Accepted. Fixed in revision 84. Revision 95 reads: "says that mathematicians in general 'have a responsibility to' engage in public discourse."
Section 4.2 said the AIGS standard "traces a result through" its chain; the chain is one a result "may" pass through.	C34	Accepted. Fixed in revision 84. Revision 95 reads: "describes a chain through which a result may pass."
Section 4.2 quoted the AIGS sentence on corrections without "Substantive."	C34	Accepted. Fixed in revision 84. Revision 95 reads: "[s]ubstantive corrections should be visible rather than silently replacing the historical record."
Section 4.2 called the two documents "norms for mathematics produced with AI"; the AIGS standard covers all of science, and the Leiden sentence is a value of mathematical research in general.	C34	Accepted. Fixed in revision 84. Revision 95 reads: "Two earlier documents state norms close to parts of the standard"; "counts among the values of mathematical research."

Section 3 misdescribed the Sienickis' audit: as an audit of results rather than reviews, of "human reviews," as one that "classifies steps" or sorts them, with the unresolved proof gap's definition given as what it is rather than what it concerns, and without saying which line it draws or how this standard classifies an unresolved proof gap.	C34, C35, C36, G33, C37, C40, C41	Accepted. Fixed in revisions 84 to 91. Revision 95 reads: "A recent audit of reviews of mathematical results that OpenAI announced in 2026 names four outcomes that guide its reading of the reviews, two of which concern incomplete steps"; "which 'concerns a necessary step that has not been justified sufficiently for independent verification,'"; "As I read them, both are gaps under this standard."
Section 3 tied the audited results to a count and a date.	C34, C35, G32, C36, C37	Accepted. Fixed in revision 87. Revision 95 reads: "mathematical results that OpenAI announced in 2026."
Section 3: "in each, the text leaves part of the step to the reader," though Ref. 23 defines an unresolved proof gap by insufficient justification, and "two of which concern incomplete steps" is not Ref. 23's phrase.	C44, C45, G34, G37	Answered. "[A] necessary step that has not been justified sufficiently for independent verification" (Ref. 23, page 3) is one the text does not carry out far enough for the reader to verify, whether it later proves true or false; that is the sense of "leaves part of the step to the reader," and "As I read them" marks the sentence as the paper's reading. If such a step is later shown to be false, it is also a false step, listed separately (Section 3, "False step"). "[T]wo of which concern incomplete steps" is the paper's grouping and is not in quotation marks.

The paragraph on the Sienickis' audit sits in Section 3, "Definitions," though it defines nothing.	C48	Answered. The paragraph applies the definition of Gap to two outside categories, so it sits with the definition it applies.
Section 3 says the audit names four outcomes but gives only two.	C44	Accepted. The other two are "confirmed mathematical error" and "verification incomplete," which "means that the checking was not deep enough to support either a positive or a negative mathematical judgment about the relevant step or dependency" (Ref. 23, page 3). The paper compares the two it groups as concerning incomplete steps.

Whether Ref. 23′s results include the report of ten results in Section 1.1.	C38, C39, C40, C42, C43, C44, C45	Accepted as a question the paper leaves open; the pages show this much. Ref. 23 asks what human scrutiny has established about "the ten mathematical results announced by OpenAI on 1 August 2026," and reads its evidence alongside "public Lean formalizations" (page 1), and says that "Chapter 1 receives high-confidence assessments of its main Cohn–Elkies asymptotic result" (page 5). Section 1.1 places a report of ten results, with Lean formalizations, among them the sphere-packing result of Section 5.6, "By 12 Sept," and quotes MIT Technology Review on 8 September calling Astra, the model credited with that result, "released just last week." Whether the two are the same report I have not established. No claim in the paper depends on it.
The AIGS quotations had no page numbers, Ref. 23 had no link and gave one of its two dates, and the paper did not say that its AIGS page numbers are the printed ones.	C34, C35, G32	Accepted. Fixed in revisions 84 and 85. Revision 95 gives the pages, Ref. 23′s link and both of its dates, and says in Ref. 22: "Page numbers are the document′s printed numbers."
Ref. 22′s DOI is not printed in the AIGS document.	C34, C35, G32	Accepted. Fixed in revision 89. Revision 95 reads: "the DOI that Ref. 23 gives for it; the document itself says 'DOI: to be assigned upon publication'."

Section 4.2 left out the AIGS standard's responsible human submitter, then called the submitter's responsibilities "other matters of the deposit (page 6)," a word page 6 does not use.	C35, C36, G33	Accepted. Fixed in revisions 85 and 86. Revision 95 reads: "The AIGS standard's template recommends naming the human submitters responsible for the deposit (page 12)." Section 4.2 then quotes the page 6 list in full.
Section 4.2 says the AIGS template "recommends naming the human submitters responsible for the deposit," though page 12 names those responsible "for the metadata and public deposit," and the template itself is what is recommended.	C46	Answered. The template, which "is recommended for primary AI-generated scientific submissions," says "Name the human submitter(s) responsible for the metadata and public deposit" (page 12). The paper's "responsible for the deposit" shortens the object and is not a quotation. The paper's "recommends naming" describes this instruction in a recommended template; it is not a quotation.
Section 9.1, item 4 said that "the AIGS archive keeps" a record "for results produced with AI," that "the Sienickis ask," and "that record" without saying which.	C35, G32, C36, G33, C37	Accepted. Fixed in revisions 85 to 87. Revision 95 reads: "The AIGS standard sets out a related record for work to which AI has made a substantive contribution"; "the Sienickis hold, of reviews, that"; "This item places the record of questions and answers with the producer of the result."
Section 4.2 described the AIGS archive's scope without its records that evaluate or challenge such work, and cited page 8 alone for it.	C38, C39	Accepted. Fixed in revisions 88 and 89. Revision 95 reads: "and of records that evaluate, correct or challenge such work (Ref. 22, pages 3 to 5 and 8)."

Section 4.2 narrowed the Leiden Declaration's statement of responsibility to "correctness," and dropped its condition, "When automated techniques are employed."	C38, C40	Accepted. Fixed in revisions 88, 90 and 95. Revision 95 reads: "The Leiden Declaration, where automated techniques are employed in published mathematical research, places responsibility for 'the correctness and adequacy of the arguments and results,' and for the citations of prior work, 'exclusively with the human authors.'"
Section 4.2 says the Leiden Declaration "places" responsibility with the human authors; the Declaration says it "remains exclusively with the human authors."	C55	Accepted as wording. "Places ... exclusively with the human authors" paraphrases the Declaration's "remains exclusively with the human authors"; the quoted words are the Declaration's.
Section 4.2's "where automated techniques are used" drops the Declaration's "in published mathematical research."	G35, G38	Accepted. Fixed in revision 95. Revision 95 reads: "where automated techniques are employed in published mathematical research."
Section 4.2 says the Leiden Declaration places responsibility "for the citations of prior work"; the Declaration speaks of "the completeness and accuracy of citations to relevant prior work."	C47	Accepted as wording. The Declaration's clause is "the completeness and accuracy of citations to relevant prior work"; the paper's "the citations of prior work" shortens it.
Section 4.2: "Neither makes answering the duty of a named presenter" is stated as fact.	C37, C39	Accepted. Fixed in revision 89. Revision 95 reads: "As I read them, neither makes answering the duty of a named presenter."

Section 4.2: "The standard makes answering the presenter's duty" follows sentences in which "the standard" is the AIGS standard.	C48	Accepted. Fixed in revision 93. Revision 95 reads: "This paper's standard makes answering the presenter's duty."
Section 4.2 uses "the standard" for this paper's standard in its opening sentence and for the AIGS standard in the sentence on its template.	C50, C51	Accepted as wording. In the paragraph's opening sentence, "the standard" is this paper's standard. In the sentence on the template, "the standard" follows "The AIGS standard's template" in the same sentence, and the next sentence names this paper's standard explicitly.
Section 4.2: "As I read them, neither makes answering the duty of a named presenter," though the Leiden Declaration places responsibility with named authors and gives mathematicians a responsibility to engage in public discourse.	C46	Answered. The Leiden Declaration says that results "are attributable to specific authors who take credit for their discovery and assume responsibility for their correctness," and gives mathematicians in general a responsibility to explain and contextualize methods and results assisted by AI in public discourse. Neither sentence gives a named person a duty to answer the questions asked about a result, which is requirement 3. No other passage of the Declaration, which I read in full, gives a named person a duty to answer questions about a result. Absence cannot be shown by quoting (record 5.2). "As I read them" marks the sentence as a reading.

Section 4.2 speaks of "two earlier documents," while Appendix C.3 speaks of three.	C40, C43, C44, C45, C48, C54	Answered. Section 4.2 says that two documents, the Leiden Declaration (Ref. 21) and the AIGS standard (Ref. 22), state norms close to parts of the standard; it does not say that no other document does. Appendix C.3 counts the three documents that revision 83 added as precedents. The paper cites the third, Ref. 23, in Section 3 and in Section 9.1, item 4. Section 9.1, item 4 also calls the AIGS standard and Ref. 23 precedents ("The proposal has precedents").
A12's distance formula needed √0 for coincident points, and A1 gives square roots only of positive numbers.	C34, C35, C36	Accepted. Fixed in revision 86. Revision 95 reads: "where √0 means 0." A1 is unchanged.
A12 does not define the difference of points, the dot product or the cosine.	C35	Accepted in part. The difference of points, the dot product and the cosine are notation the reader knows (Section 3: "the terms, notation and conventions of the field"). The properties of the cosine that the angle measure needs are not notation, and A12 assumes them (next row). A.12's own steps use none of the angle items (record 4.4).
A12's angle measure needs the ratio to lie between −1 and 1 and to give exactly one angle.	C36, C37	Accepted. Fixed in revision 87. Revision 95 reads: "That this ratio lies strictly between −1 and 1 when X, Y and Z are not on one line, that the cosine takes each such value exactly once between 0° and 180°."

Appendix C.3 says every quoted source was supplied in full and checked word for word, and does not list the misdescriptions of Refs. 21 to 23.	C34, C35, C38, C39, C40, C41	Accepted in part. Fixed in revisions 89 to 91. Revision 95 reads: "Revision 83 added three earlier documents as precedents (Refs. 21 to 23), and that revision and later ones described them in places in ways they do not bear out." The sentence on quotations is answered in the next row.
The record's claim that the sentence on quotations in Appendix C.3 holds is larger than the corrections in the rows above support.	C44, C54	Accepted in part. Every quotation of Refs. 21 to 23 in revision 95 matches the full texts word for word. The problems in the rows above were in descriptions and in what a quotation left out, such as "Substantive." The record does not show that each was checked as it was added; the rows above list what reviewers found.
Appendix C.3: "later ones" could include revision 91, and Part 6 does not give a correcting revision for every finding.	C42, G34, C49	Accepted as wording. "Later ones" means the revisions after 83 whose descriptions of Refs. 21 to 23 a later revision corrected; the rows above give the revisions that corrected each misdescription. Where a row gives a range, the finding had several parts, corrected over those revisions, and the row quotes the text that stands at revision 95.

Appendix C.3 says Part 6 "lists each finding and the revision that corrected it," though Part 6's Answered rows name no correcting revision; and the row above read "each finding" more narrowly than Appendix C.3 says.	G36	Accepted. Fixed in revision 94. Revision 95 reads: "lists each finding and its answer, with the revision that corrected the text where one did."
Section 4.2 says the AIGS standard "governs" the archive, which pages 3 to 5 and 8 do not say.	G36, C54, G37, C55, G39	Accepted as wording. The standard says it "establishes the initial scope, terminology, provenance requirements, submission principles, curation rules, classification system, and verification-status framework" of the AIGS archive (page 1). Section 4.2 does not cite page 1.
The header said the review record "answers every finding."	C37, C38	Accepted. Fixed in revisions 88, 92 and 93. Revision 88 limited the claim to the reviews of Draft v6; revisions 92 and 93 replaced "every finding" with the wording quoted. Revision 95 reads: "answers the findings of the reviews of Draft v6 and describes the corrections that the reviews of the record led to."
The headers of the paper and the record give a date earlier than the latest revision.	C54	Answered. The date under the title is the date the document was created; the revision number identifies the version.

The header's "the reviews of Draft v6" and "the reviews of the record" overlap, since many reviews had both.	C50, C51	Accepted as wording. The reviews of revisions 61 to 68 are answered in Parts 1 to 4, and the reviews of revision 83 and later in Part 6. For the reviews of revisions 69 to 82, the record describes the corrections they led to (Part 5).
The header and Appendix C.3 said the record answers every finding of the reviews of Draft v6, though for the reviews of this record, which also had the paper, it lists the corrections they led to, not each finding.	C47	Accepted. Fixed in revisions 92 and 93. Revision 95 reads: "answers the findings of the reviews of Draft v6 and describes the corrections that the reviews of the record led to."
Revision 92's header and Appendix C.3 said the record "lists the corrections that the reviews of the record led to," though Part 5.1 gives only their kinds.	C48	Accepted. Fixed in revision 93. Revision 95 reads: "describes the corrections that the reviews of the record led to."
Appendix C.1 claims the continuing duty as mine, though Section 4.2 cites AIGS on a record that continues after disclosure.	C38	Answered. As Section 4.2 reads them, the AIGS standard encourages those whose work is examined "to submit responses or corrections" (page 9), but neither it nor the Leiden Declaration makes answering the duty of a named presenter. Appendix C.1 claims that duty, so the two passages do not conflict.

The row on Appendix C.1 quotes the AIGS standard as encouraging "to submit responses or corrections" (page 9), which is not the sentence on that page.	G35	Answered. Page 9 reads: "Authors, institutions, organizations, and AI developers whose work is examined are encouraged to submit responses or corrections." The quoted words are the end of that sentence, word for word.
Section 5.3, row 4 says the key results "appeared only when they were reached," though Appendix D's 07:25 figure opens with a Given step.	G32, C38, C39	Answered. The Given step lists the given facts: AB and BC, A, B and C on one line, the touch at T, A opposite T, and B on the big circle. None of the key results the proof rests on is in it: Thales' theorem (steps 1 and 2), the right angle at the touching point (step 3), and the similarity of the two triangles with the ratio of their sides (steps 4 to 6). That AT is a diameter with midpoint O follows from the definitions of opposite and circle (Appendix A.2, item 2); it is part of the given configuration, not one of the key results.
Cohn and Miller (2016) is not in the References; A.11's Euclid chain is asserted.	C34, C37, C39	Accepted, as in record 4.5 (Cohn and Miller) and record 3.4 (A.11).
